printer font

printer font A font that is only available for use by a printer and cannot be displayed onscreen. If text is formatted with a printer font, it is displayed onscreen using a default screen font. You must wait until you print to see what the printer fonts used in a document look like. Printer fonts can be built into the printer (resident fonts), downloaded from disk into the printer's memory, or stored in a font cartridge. Users of Apple Macintosh computers or Microsoft Windows who may wish to avoid the discrepancy between screen and printer fonts can buy Adobe Type Manager (ATM) or Apple's TrueType outline fonts, which look the same on-screen as when printed.

program *v.* To write a set of instructions that a computer can execute.

n. A set of instructions that a computer can execute. A program is a sequence of directions, called statements, that specify exactly what the computer needs to do to accomplish a predetermined task. A program is written in a programming language, a specially constructed vocabulary and set of rules for instructing a computer. Generally, one programs in a high-level language, such as Pascal, C, C++, or BASIC. Programs can also be written in assembly language, a low-level language one step removed from the machine language understood by the computer.

Programming instructions are often referred to as code. The program as written by the programmer is called the source code. A program that has been translated into machine language and is ready to run is known as an *executable program* or *executable code*. Software that you purchase consists of one or more executable programs.
